

Biophysical Society 62nd Meeting, Feb. 17-21, 2018, San Francisco, California

Fancy A Jellyfish Chip?

Danish researchers developed a new method to rapidly transform the soft umbrella-shaped jellyfish body into a crunchy treat.

EMBARGOED for release until 8 a.m. EST on Feb. 20, 2018

WASHINGTON, D.C., February 20, 2018 -- Our brains weave together inputs from sight, taste and smell to determine whether food is safe and enjoyable to eat. Though it is often overlooked, texture also has a powerful effect on how we perceive and enjoy food. Mathias P. Clausen, a postdoctoral fellow at University of Southern Denmark in Odense, Denmark, became intrigued by jellyfish when he bit into the marine delicacy and experienced an unexpected crunch.

“Tasting jellyfish myself, I wanted to understand the transformation from a soft gel to this crunchy thing you eat,” Clausen said.

Clausen and a team of other Danish scientists combined their expertise in biophysics and biochemistry to gain a better understanding of how food preparation affects jellyfish from the inside out. Clausen and his team will present their work during the 62nd Biophysical Society Annual Meeting, held Feb. 17-21, in San Francisco, California.

Jellyfish have been a staple in Asian cuisine for centuries, but remain an oddity to the western palate. Traditionally, the bell or body of a jellyfish is marinated in salt and potassium alum for several weeks to produce a crunchy, picklelike texture. The Danish research team developed a new technique that produces the same results in only a few days.

“Using ethanol, we have created jellyfish chips that have a crispy texture and could be of potential gastronomic interest,” Clausen said.

The research team further investigated how the long fibrous filaments in the gelatinous jellyfish bell are transformed during the curing process to produce the crunchy texture. “Little is known about the molecular anatomy of the jellyfish,” Clausen said. “We are still not completely sure which structures we are visualizing.”

Overfishing and climate change have diminished (traditional) commercially available fishing stock. Jellyfish have filled in this gap and now, their booming populations are producing swarms. As a result, the fishing industry is looking to jellyfish as a viable food source for the expanding global population. Furthermore, jellyfish have numerous health benefits; they are rich in vitamin B12, magnesium, phosphorus, iron and selenium.

According to Clausen, the team hopes to delve deeper to understand the structures within the jellyfish bell and what eating them would feel like inside your mouth. This new scientific approach may affect future commercial viability of jellyfish, as well as other foods not commonly found on the dinner plate.

“As this is pioneering work, I think using tools available to us to tackle the science of good eating can open peoples’ eyes for a completely new scientific field,” Clausen said.

2662-Pos, Board B678 “The microscopic structure of crunchy and crispy jellyfish” is authored by Mie T. Pedersen, Morten Christensen, Lars Duelund, Per L. Hansen, Jonathan R. Brewer and Mathias P. Clausen. It will be displayed at 1:45 p.m. PST on Tuesday, Feb. 20, 2018, in the South Hall ABC of the Moscone Center, South. Abstract: <https://plan.core-apps.com/bpsam2018/abstract/598979c882021290aae09439cc2cc95a>

MORE MEETING INFORMATION

ABOUT THE MEETING

Each year, the Biophysical Society Annual Meeting brings together more than 6,000 researchers working in the multidisciplinary fields representing biophysics. With more than 3,600 poster presentations, over 200 exhibits, and more than 20 symposia, the BPS Annual Meeting is the largest meeting of biophysicists in the world. Despite its size, the meeting retains its small-meeting flavor through its subgroup symposia, platform sessions, social activities and committee programs. The 62nd Annual Meeting will be held at the Moscone Center (South) in San Francisco, California.

PRESS REGISTRATION

The Biophysical Society invites professional journalists, freelance science writers and public information officers to attend its Annual Meeting free of charge. For press registration, contact Ellen Weiss at EWeiss@biophysics.org or the Media Line at the American Institute of Physics at media@aip.org or 301-209-3090.

NEWS RELEASES

Embargoed press releases describing in detail some of the breakthroughs to be discussed at the meeting are available on EurekAlert!, Newswise and Alpha Galileo or by contacting the Media Line at the American Institute of Physics at media@aip.org or 301-209-3090.

ABOUT THE SOCIETY

The Biophysical Society, founded in 1958, is a professional, scientific Society established to encourage development and dissemination of knowledge in biophysics. The Society promotes growth in this expanding field through its annual meeting, monthly journal, and committee and outreach activities. Its 9,000 members are located throughout the U.S. and the world, where they teach and conduct research in colleges, universities, laboratories, government agencies, and industry. For more information on the Society, or the 2018 Annual Meeting, visit <http://www.biophysics.org>.
